The ITU Monitoring Handbook

MONITORING NETWORKS DESIGN

ITU Monitoring Handbook

- The planning of a monitoring station is based on the work of Pavliuk et al.[3],[4] and [5], and is based on the calculation of coverage zones with reference to the two tasks for which spectrum monitoring is typically used. Most of the coverage calculations are based on ITU Report ITU-R BS.944. This work suggests a blanket approach for the estimation of the area covered by a monitoring station. Kogan and Pavliuk also recommend the use of the ITU-R P.1546 recommendation for propagation model.

PROCEDURES FOR PLANNING AND OPTIMIZATION OF SPECTRUM-MONITORING NETWORKS IN THE VHF/UHF FREQUENCY RANGE

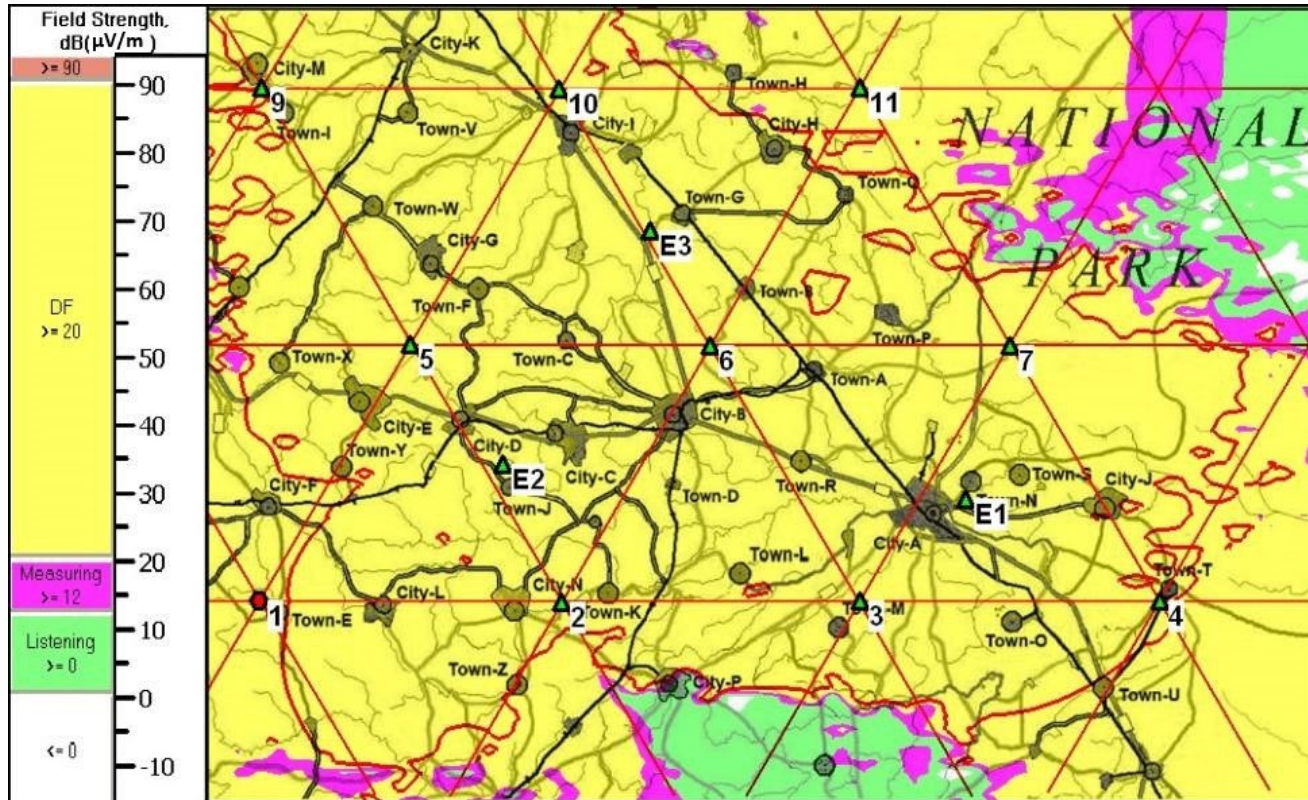

Coverage of Monitoring Stations

- The coverage zones of the existing stations are calculated for different monitoring functions with the aid of computer software with at least the features described in Chapter 5 of the ITU Handbook on Computer-Aided Techniques for Spectrum Management (2015 edition).

Overall monitoring coverage zones of the three existing stations

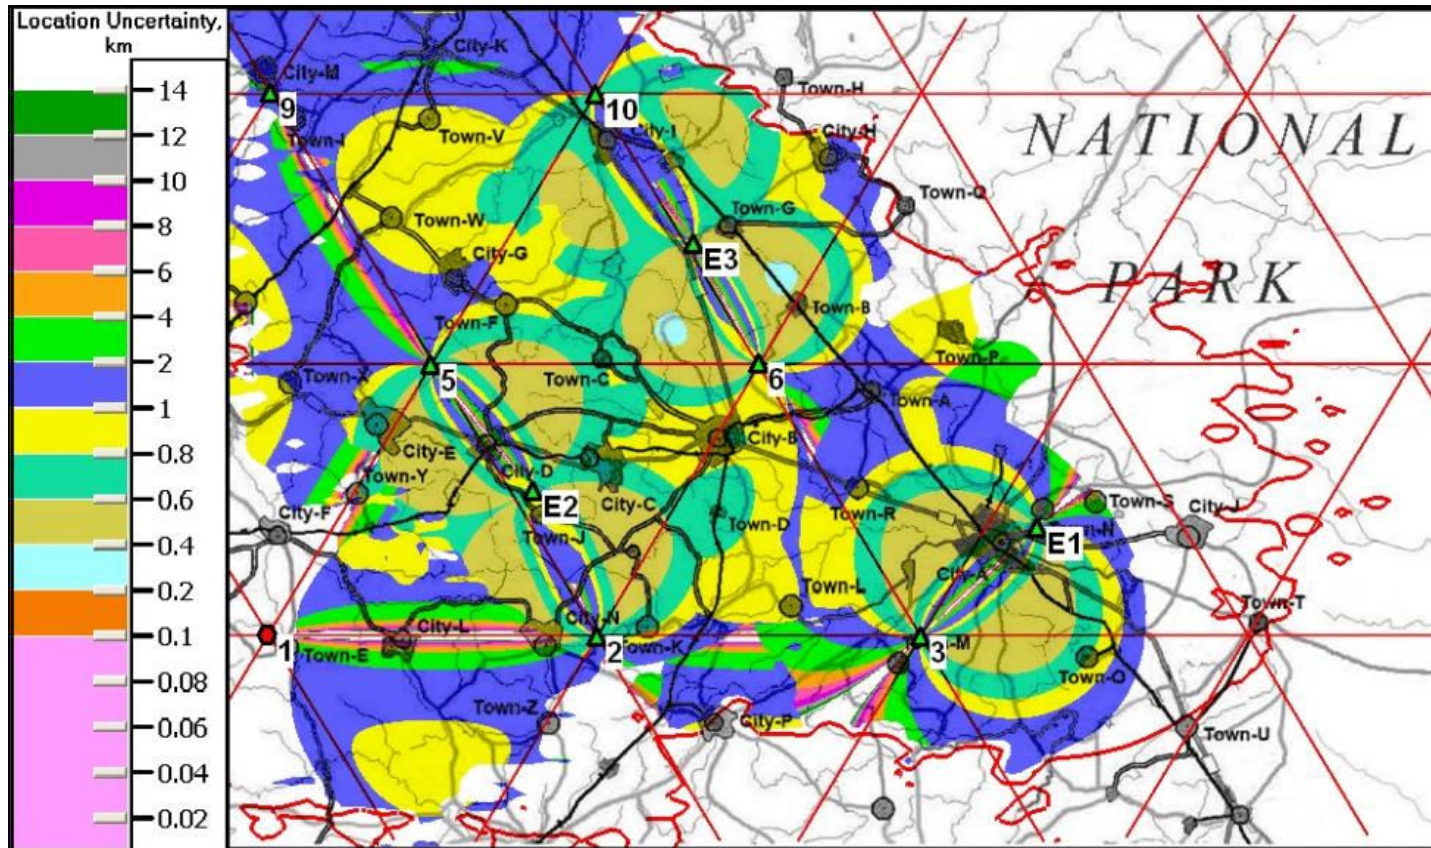

Coverage of Monitoring Stations

11 stations, regular grid, category II transmitters (power 10 W, antenna height 20 m)

Coverage of DF Stations

Location coverage without stations 4, 7 and 11

Architecture of Grid Monitoring

LATIN AMERICA SITUATION

Monitoring in Developed Countries

- NTIA develops its own monitoring system with home made software.
- Most manufacturers develop specific equipment according to NTIA requirements.
- Same situation occurs with the German BNETZA or the British OFCOM.

Monitoring in Latin American Countries

- Monitoring networks specifications are based on ITU recommendations.
- ITU recommendations are manufacturers driven.
- There are important budget constraints.
- Most of the monitoring tasks are related with Broadcasting systems.
- Simpler systems can be used.

SIMONES

Economic Tradeoff

PLANNING AND OPTIMIZATION OF SPECTRUM-MONITORING NETWORKS WITH FOCUS ON SPECTRUM USERS

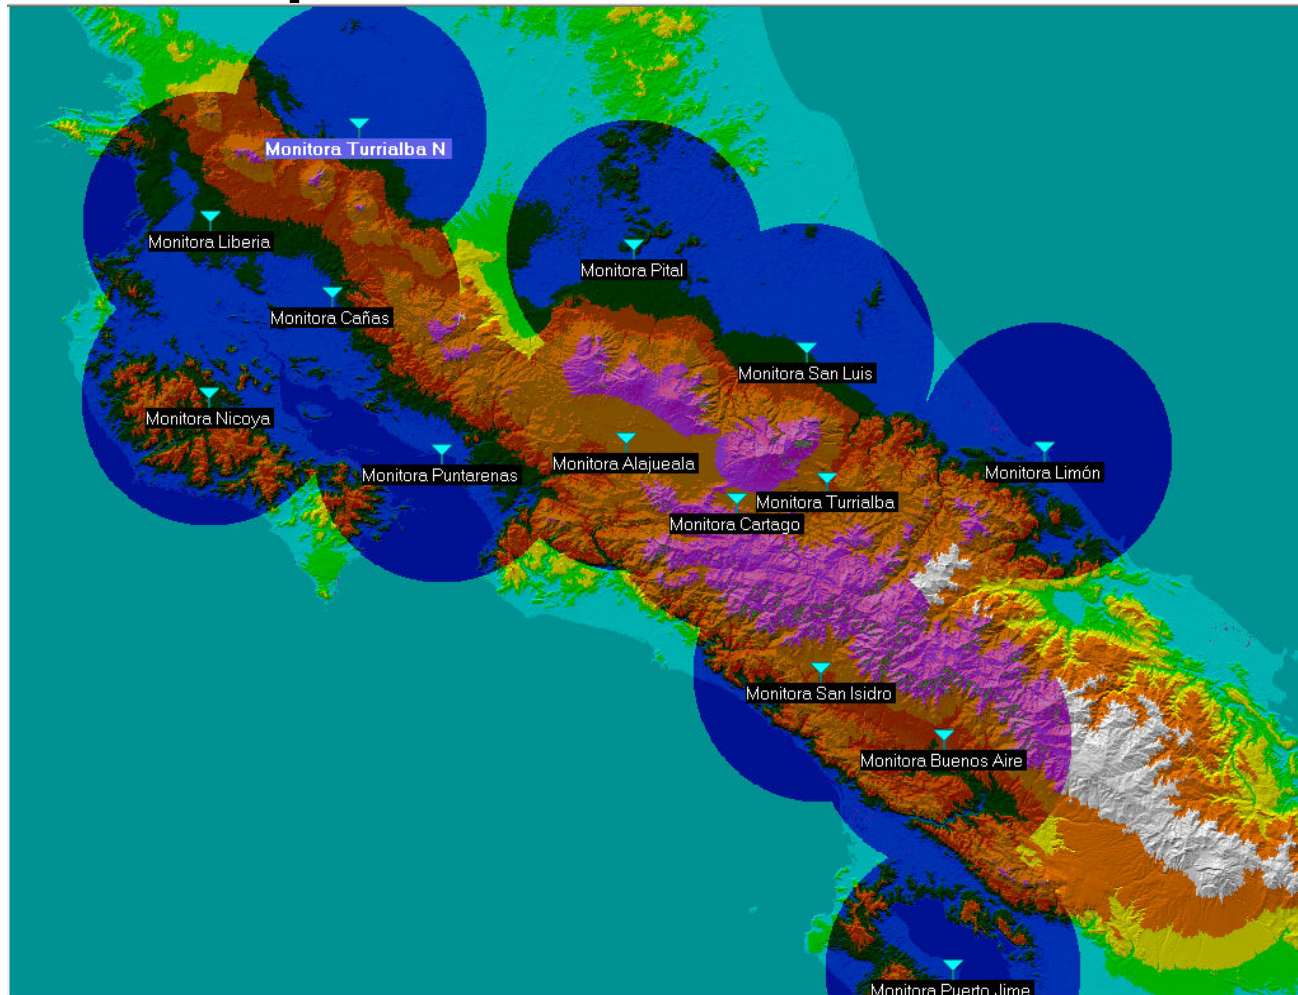

Monitoring Networks with User consideration

- In order to improve the economic efficiency of monitoring networks, we propose to include population data in design considerations.
- The priority is population coverage and not geographical coverage.
- In this way, broadcasting service areas are prioritized.
- Besides, we use semi deterministic propagation models to improve coverage simulation results.

Monitoring Networks with User consideration

- In the next slides we will show two examples of spectrum monitoring networks planned with this criteria.
- We can see the reduction of the number of fixed monitoring stations.
- And therefore the cost of the system.
- Not covered geographical areas are attended with mobile or transportable stations.
