# ICOM 4015: Advanced Programming 

## Lecture 4

## Chapter Four: Fundamental Data Types

## CAY H ORSTMANN

Chapter Four: Fundamental Data Types

ICOM 4015 Fall 2008

## Chapter Goals

- To understand integer and floating-point numbers
- To recognize the limitations of the numeric types
- To become aware of causes for overflow and roundoff errors
- To understand the proper use of constants
- To write arithmetic expressions in Java
- To use the string type to define and manipulate character strings
- To learn how to read program input and produce formatted output

## Number Types

- int: integers, no fractional part

1,-4, 0

- double: floating-point numbers (double precision)
0.5,-3.11111, 4.3E24, 1E-14
- A numeric computation overflows if the result falls outside the range for the number type

```
int n = 1000000;
System.out.println(n * n); // prints -727379968
```

- Java: 8 primitive types, including four integer types and two floating point types

## Primitive Types

| Type | Description | Size |
| :--- | :--- | :--- |
| int | The integer type, with range $-2,147,483,648 \ldots 2,147,483,647$ | 4 <br> bytes |
| byte | The type describing a single byte, with range $-128 \ldots 127$ | 1 byte |
| short | The short integer type, with range $-32768 \ldots 32767$ | 2 <br> bytes |
| long | The long integer type, with range $-9,223,372,036,854,775,808 \ldots$ <br> $-9,223,372,036,854,775,807$ | 8 <br> bytes |
| double | The double-precision floating-point type, with a range of about $\pm 10^{308}$ <br> and about 15 significant decimal digits | 8 <br> bytes |
| float | The single-precision floating-point type, with a range of about $\pm 10^{38}$ and <br> about 7 significant decimal digits | 4 <br> bytes |
| char | The character type, representing code units in the Unicode encoding <br> scheme | 2 <br> bytes |
| boolean | The type with the two truth values false and true | 1 bit |

## Number Types: Floating-point Types

- Rounding errors occur when an exact conversion between numbers is not possible

```
double f = 4.35;
System.out.println(100 * f); // prints 434.99999999999994
```

- Java: Illegal to assign a floating-point expression to an integer variable

```
double balance = 13.75;
int dollars = balance; // Error
```

- Casts: used to convert a value to a different type

```
int dollars = (int) balance; // OK
```

Cast discards fractional part.

## Number Types: Floating-point Types (cont.)

Math. round converts a floating-point number to nearest integer
long rounded $=$ Math.round (balance); // if balance is 13.75, then

```
// rounded is set to 14
```

## Syntax 4.1 Cast

(typeName) expression

## Example:

(int) (balance * 100)
Purpose:
To convert an expression to a different type.

## Self Check 4.1

## Which are the most commonly used number types in Java?

Answer: int and double

## Self Check 4.2

When does the cast (long) x yield a different result from the call Math. round (x)?

Answer: When the fractional part of $x$ is $\geq 0.5$

## Self Check 4.3

How do you round the double value x to the nearest int value, assuming that you know that it is less than 2 - 109?

Answer: By using a cast: (int) Math.round (x)

## Constants: final

- A final variable is a constant
- Once its value has been set, it cannot be changed
- Named constants make programs easier to read and maintain
- Convention: use all-uppercase names for constants

```
final double QUARTER_VALUE = 0.25;
final double DIME_VALUE = 0.1;
final double NICKEL_VALUE = 0.05;
final double PENNY_VALUE = 0.01;
payment = dollars + quarters * QUARTER_VALUE
    + dimes * DIME_VALUE + nickels * NICKEL_VALUE
    + pennies * PENNY_VALUE;
```

## Constants: static final

- If constant values are needed in several methods, declare them together with the instance fields of a class and tag them as static and final
- Give static final constants public access to enable other classes to use them

```
public class Math
    {
    public static final double E = 2.7182818284590452354;
    public static final double PI = 3.14159265358979323846;
}
double circumference = Math.PI * diameter;
```

## Syntax 4.2 Constant Definition

In a method:
final typeName variableName = expression;
In a class:
accessSpecifier static final typeName variableName = expression;

## Example:

final double NICKEL_VALUE = 0.05; public static final
double LITERS_PER_GALLON = 3.785;

## Purpose:

To define a constant in a method or a class.

## ch04/cashregister/CashRegister.java

```
01: /**
02: A cash register totals up sales and computes change due.
03:
04: public class CashRegister
05: {
06: /**
07: Constructs a cash register with no money in it.
08:
09: pubblic CashRegister()
10: {
11: purchase = 0;
12: payment = 0;
13: }
14:
15: /**
16: Records the purchase price of an item.
17: @param amount the price of the purchased item
18: */
19: public void recordPurchase(double amount)
20: {
21: purchase = purchase + amount;
22:

Big Java by Cay Horstmann

## Self Check 4.4

What is the difference between the following two statements?
final double CM_PER_INCH = 2.54; and
public static final double CM_PER_INCH = 2.54;

Answer: The first definition is used inside a method, the second inside a class.

## Self Check 4.5

What is wrong with the following statement?
double circumference $=3.14 *$ diameter;
Answer: (1) You should use a named constant, not the "magic number" 3.14
(2) 3.14 is not an accurate representation of $\pi$.

## Assignment, Increment, and Decrement

- Assignment is not the same as mathematical equality:
items $=$ items +1 ;
- items++ is the same as items = items + 1
- items-- subtracts 1 from items

## Assignment, Increment, and Decrement

## Figure 1 <br> Incrementing a Variable

Big Java by Cay Horstmann Copyright © 2008 by John Wiley \& Sons. All rights reserved.

## Self Check 4.6

What is the meaning of the following statement?
balance $=$ balance + amount;
Answer: The statement adds the amount value to the balance variable.

## Self Check 4.7

What is the value of $n$ after the following sequence of statements?

$$
\begin{aligned}
& \mathrm{n}--; \\
& \mathrm{n}++; \\
& \mathrm{n}--;
\end{aligned}
$$

Answer: One less than it was before.

## Arithmetic Operations

- / is the division operator
- If both arguments are integers, the result is an integer. The remainder is discarded
- 7.0 / 4 yields 1.75

7 / 4 yields 1

- Get the remainder with \% (pronounced "modulo") 7 \% 4 is 3

## Arithmetic Operations

```
final int PENNIES_PER_NICKEL = 5;
final int PENNIES_PER_DIME = 10;
final int PENNIES_PER_QUARTER = 25;
final int PENNIES_PER_DOLLAR = 100;
// Compute total value in pennies
int total = dollars * PENNIES_PER_DOLLAR + quarters *
    PENNIES_PER_QUARTER + nickels * PENNIES_PER_NICKEL +
    dimes * PENNIES_PER_DIME + pennies;
// Use integer division to convert to dollars, cents
int dollars = total / PENNIES_PER_DOLLAR;
int cents = total % PENNIES_PER_DOLLAR;
```

## The Math class

- Math class: contains methods like sqre and pow
- To compute $x^{n}$, you write Math. pow (x, n)
- However, to compute $x^{2}$ it is significantly more efficient simply to compute x * x
- To take the square root of a number, use the Math. sqrt; for example, Math.sqrt (x)
- In Java,

$$
\frac{-b+\sqrt{b^{2}-4 a c}}{2 a}
$$

can be represented as
(-b + Math.sqrt (b * b - 4 * a * c) ) / (2 * a)

## Mathematical Methods

| Function | Returns |
| :--- | :--- |
| Math. $\operatorname{sqrt}(\mathrm{x})$ | square root |
| Math.pow $(\mathrm{x}, \mathrm{y})$ | power $x^{y}$ |
| Math. $\exp (\mathrm{x})$ | $\mathrm{e}^{x}$ |
| Math. $\log (\mathrm{x})$ | natural log |
| Math. $\sin (x)$, Math. $\cos (x)$, Math.tan $(x)$ | sine, cosine, tangent $(x$ in radians $)$ |
| Math.round $(x)$ | closest integer to $x$ |
| Math.min $(x, y), \operatorname{Math} . \max (x, y)$ | minimum, maximum |

## Analyzing an Expression

Figure 2 Analyzing an Expression

## Self Check 4.8

## What is the value of 1729 / 100? Of 1729 \% 100?

Answer: 17 and 29

## Self Check 4.9

Why doesn't the following statement compute the average of s1, s2, and s3?
double average = s1 + s2 + s3 / 3; // Error
Answer: Only s3 is divided by 3 . To get the correct result, use parentheses. Moreover, if $s 1, s 2$, and $s 3$ are integers, you must divide by 3.0 to avoid integer division:
$(s 1+s 2+s 3) / 3.0$

## Self Check 4.10

What is the value of Math.sqrt (Math. pow (x, 2) + Math. pow (y,
2)) in mathematical notation?

Answer: $\sqrt{x^{2}+y^{2}}$

## Calling Static Methods

- A static method does not operate on an object double $x=4$; double root $=x . s q r t() ; / /$ Error
- Static methods are defined inside classes
- Naming convention: Classes start with an uppercase letter; objects start with a lowercase letter
Math
System.out

## Syntax 4.3 Static Method Call

ClassName.methodName (parameters)

## Example:

Math.sqrt(4)

## Purpose:

To invoke a static method (a method that does not operate on an object) and supply its parameters.

## Self Check 4.11

Why can't you call x . pow ( y ) to compute $x^{y}$ ?
Answer: x is a number, not an object, and you cannot invoke methods on numbers.

## Self Check 4.12

Is the call System.out. println(4) a static method call?
Answer: No - the println method is called on the object System.out.

## Strings

- A string is a sequence of characters
- Strings are objects of the String class
- String constants:
"Hello, World!"
- String variables:

String message = "Hello, World!";

- String length:

```
int n = message.length();
```

- Empty string: ""

## Concatenation

- Use the + operator:

```
String name = "Dave";
String message = "Hello, " + name; // message is "Hello,
    Dave"
```

- If one of the arguments of the + operator is a string, the other is converted to a string

```
String a = "Agent"; int n = 7; String bond = a + n; //
bond is "Agent7"
```

## Concatenation in Print Statements

- Useful to reduce the number of System. out. print instructions

```
System.out.print("The total is ");
System.out.println(total);
```

versus

```
System.out.println("The total is " + total);
```

## Converting between Strings and Numbers

- Convert to number:

```
int n = Integer.parseInt(str);
double x = Double.parseDouble(x);
```

- Convert to string:

```
String str = "" + n;
str = Integer.toString(n);
```

## Substrings

-String greeting = "Hello, World!"; String sub $=$ greeting. substring(0, 5); // sub is "Hello"

- Supply start and "past the end" position
- First position is at 0

| H | e | 1 | 1 | o | , |  | W | o | r | 1 | d | ! |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 |

Figure 3 String Positions

## Substrings (cont.)

Substring length is "past the end" - start

## Figure 4 Extracting a Substring

## Self Check 4.13

Assuming the string variable s holds the value "Agent", what is the effect of the assignment $s=s+\operatorname{s.length()?~}$

Answer: s is set to the string Agent5

## Self Check 4.14

Assuming the String variable river holds the value "Mississippi ", what is the value of river.substring (1, 2)? Of
river.substring(2, river.length() - 3)?
Answer: The strings "i" and "ssissi"

## Reading Input

- System.in has minimal set of features-it can only read one byte at a time
- In Java 5.0, Scanner class was added to read keyboard input in a convenient manner
- Scanner in = new Scanner(System.in);

```
    System.out.print("Enter quantity:");
```

    int quantity \(=\) in.nextInt();
    - nextDouble reads a double
- nextLine reads a line (until user hits Enter)
- nextWord reads a word (until any white space)

## ch04/cashregister/CashRegisterSimulator.java

```
01: import java.util.Scanner;
02:
03:
04: This program simulates a transaction in which a user pays for an
item
05: and receives change.
06:
07: public class CashRegisterSimulator
08: 
09: public static void main(String[] args)
10: {
11: Scanner in = new Scanner(System.in);
12:
13: CashRegister register = new CashRegister();
14:
15: System.out.print("Enter price: ");
16: double price = in.nextDouble();
17: register.recordPurchase(price);
18:
19: System.out.print("Enter dollars: ");
20: int dollars = in.nextInt();
```

## ch04/cashregister/CashRegisterSimulator.java (cont.)

## Output:

Enter price: 7.55
Enter dollars: 10
Enter quarters: 2
Enter dimes: 1
Enter nickels: 0
Enter pennies: 0
Your change: is 3.05

## Reading Input From a Dialog Box

## An Input Dialog Box

## Reading Input From a Dialog Box

- String input = JOptionPane.showInputDialog (prompt)
- Convert strings to numbers if necessary: int count = Integer.parseInt(input);
- Conversion throws an exception if user doesn't supply a number - see chapter 11
- Add System.exit(0) to the main method of any program that uses JoptionPane

## Self Check 4.15

Why can't input be read directly from system.in?
Answer: The class only has a method to read a single byte. It would be very tedious to form characters, strings, and numbers from those bytes.

## Self Check 4.16

Suppose in is a scanner object that reads from System.in, and your program calls
String name $=$ in.next ();
What is the value of name if the user enters John Q. Public?
Answer: The value is "John". The next method reads the next word.
