Definition

Woodward [1]^a, introduced the ambiguity function in his book "*Probability and Information Theory with Applications to Radar*" for dealing with the radar problem.

The main contribution of this work was to provide a unified method for obtaining, on the same surface, two variables of great importance for the radar problem: the range (expressed as time delay), and Doppler (expressed as frequency shift).

[1] P.M. Woodward, 1964

Ambiguity Function Formulation

In continuous form, the ambiguity function of two signals $x(t)$ and $y(t)$, can be expressed as:

$$A_{x,y}(\tau, \nu) = \int x\left(t + \frac{\tau}{2}\right) y^*\left(t - \frac{\tau}{2}\right) e^{j2\pi\nu t} dt \quad (1)$$

Ambiguity function plays an important role in the analysis of non-stationary signals [2]^b[3]^c.

Definition

The Wigner distribution [4]^d is a quasiprobability distribution. It was introduced by Eugene Wigner in 1932 to study quantum corrections to classical statistical mechanics.

In continuous form, the Wigner distribution of a signal $x(t)$ can be expressed as:

$$\mathcal{W}_x(t, f) = \int_{-\infty}^{\infty} x\left(t + \frac{\tau}{2}\right) x^*\left(t - \frac{\tau}{2}\right) e^{-j2\pi f\tau} d\tau \quad (2)$$

The Wigner distribution is a real function and it can get positive or negative values, preserving time and frequency shifts.

Definition

In signal processing, the correlation function is a measure of similarity of two waveforms as a function of a time-lag applied to one of them.

For continuous functions, $x(t)$ and $y(t)$, the correlation function is defined as:

$$C_{x,y}(t) = \int_{-\infty}^{\infty} x(\tau)y^*(t + \tau)d\tau \quad (3)$$

Definition

Fourier operators will be very useful in the time-frequency analysis theory. We can define these operators in the following manner:

$$\mathcal{F}_{v_0}\{f(v_0, v_1, \dots, v_{L-1})\} = \int_{-\infty}^{\infty} f(v_0, v_1, \dots, v_{L-1})e^{-j2\pi v_0 \eta} dv_0 \quad (4)$$

$$\mathcal{F}_{v_0}^{-1}\{f(v_0, v_1, \dots, v_{L-1})\} = \int_{-\infty}^{\infty} f(v_0, v_1, \dots, v_{L-1})e^{+j2\pi v_0 t} dv_0 \quad (5)$$

Where L is the number of variables of function f . η and t are the output variables in the direct and inverse Fourier domain.

Definition

Ambiguity function (\mathcal{A}_h) and correlation function (\mathcal{R}_h) have a mathematical relation. We present this relation below:

$$\mathcal{R}_h(t, \tau) = \int h(t', \tau) h^*(t + t', \tau) dt' \quad (6)$$

$$\mathcal{A}_h(\eta, \tau) = \mathcal{F}_t\{\mathcal{R}_h(t, \tau)\} = \int \mathcal{R}_h(t, \tau) e^{-j2\pi\eta t} dt \quad (7)$$

$$\mathcal{A}_h(\eta, \tau) = \int \left[\int h(t', \tau) h^*(t + t', \tau) dt' \right] e^{-j2\pi\eta t} dt \quad (8)$$

$$\mathcal{A}_h(\eta, \tau) = \int \int h(t', \tau) h^*(t + t', \tau) e^{-j2\pi\eta t} dt' dt \quad (9)$$

Wigner distribution (\mathcal{W}_h) and correlation function (\mathcal{R}_h) have a mathematical relation. We present this relation below:

$$\mathcal{R}_h(t, \tau) = \int h(t', \tau) h^*(t + t', \tau) dt' \quad (10)$$

$$\mathcal{W}_h(t, f) = \mathcal{F}_\tau\{\mathcal{R}_h(t, \tau)\} = \int \mathcal{R}_h(t, \tau) e^{-j2\pi f\tau} d\tau \quad (11)$$

$$\mathcal{W}_h(t, f) = \int \left[\int h(t', \tau) h^*(t + t', \tau) dt' \right] e^{-j2\pi f\tau} d\tau \quad (12)$$

$$\mathcal{W}_h(t, f) = \int \int h(t', \tau) h^*(t + t', \tau) e^{-j2\pi f\tau} dt' d\tau \quad (13)$$

Definition

The inverse Fourier relations in both cases are expressed as:

$$\mathcal{R}_h(t, \tau) = \mathcal{F}_f^{-1}\{\mathcal{W}_h(t, f)\} = \int \mathcal{W}_h(t, f) e^{j2\pi\tau f} df \quad (14)$$

$$\mathcal{R}_h(t, \tau) = \mathcal{F}_\eta^{-1}\{\mathcal{A}_h(\eta, \tau)\} = \int \mathcal{A}_h(\eta, \tau) e^{j2\pi t\eta} d\eta \quad (15)$$

Definition

Function $\mathcal{U}(\tau, \nu)$ is called delay-Doppler spread function, and it has special relevance in this research work. We want to establish a relationship between this function and the other three former system functions.

$$\mathcal{U}(\nu, \tau) = \mathcal{F}_t\{h(t, \tau)\} \quad (22)$$

$$\mathcal{U}(\nu, \tau) = \int h(t, \tau) e^{-j2\pi\nu t} dt \quad (23)$$

$$h(t, \tau) = \mathcal{F}_\nu^{-1}\{\mathcal{U}(\nu, \tau)\} \quad (24)$$

$$h(t, \tau) = \int \mathcal{U}(\nu, \tau) e^{j2\pi t\nu} d\nu \quad (25)$$

Definition

Applying Fourier properties, we obtain:

$$\mathcal{F}_t\{h^*(t, \tau)\} = \mathcal{U}^*(-\nu, \tau) \quad (26)$$

Using the correlation function, again, we obtain:

$$\mathcal{R}_h(t, \tau) = \int h(t', \tau) h^*(t + t', \tau) dt' \quad (27)$$

Applying the cross-correlation theorem, we obtain:

$$\mathcal{R}_h(t, \tau) = \int |\mathcal{H}_h(\nu, \tau)|^2 e^{j2\pi t \nu} d\nu = \mathcal{F}_\nu^{-1}\{\mathcal{U}_h(\nu, \tau)\} \quad (28)$$
